

## *Newborn benefit ratio*

Nowadays, the fertility rate in Taiwan is getting lower and lower, so we want to know the fertility rate of each region, the average age of women for childbearing, the subsidy for childbearing, and the policies changed by the government to increase the fertility rate.

To find newborn data and analyze it with big data files: maternity subsidies, average childbearing age, newborn weight, average number of women born, male to female ratio of newborns, etc...

It is mainly used in power bi to make charts, using charts to implement the entire paper, to display the analysis content and then describe the key content of the chart analysis to reflect the welfare and proportion of newborns in recent years.
